

Note to Readers: *EHP* strives to ensure that all journal content is accessible to all readers. However, some figures and Supplemental Material published in *EHP* articles may not conform to 508 standards due to the complexity of the information being presented. If you need assistance accessing journal content, please contact ehp508@niehs.nih.gov. Our staff will work with you to assess and meet your accessibility needs within 3 working days.

Supplemental Material

Multiple Trigger Points for Quantifying Heat-Health Impacts: New Evidence from a Hot Climate

Diana B. Petitti, David M. Hondula, Shuo Yang, Sharon L. Harlan, and Gerardo Chowell

Table of Contents

Table S1. Conditions Used to Define Cardiovascular Disease Events and Corresponding ICD-10 and ICD-9-CM Codes

Table S2. Conditions Used to Define Heat-Related Events and Corresponding ICD-10 and ICD-9-CM Codes

Table S3. Conditions Used to Define Category of Events: Possible Consequences of Heat or Dehydration and Corresponding ICD-10 and ICD-9-CM Codes

Algorithm for Calculation of Heat Index Based on Steadman 1979; NWS 2014

Figure S1. Framework for Physiologic and Pathophysiologic Effects of Heat or Dehydration on Conditions Used to Define This Category

Figure S2. Modeled Relationship Between Relative Risk of Cardiovascular Hospitalizations and Six Different Temperature Metrics

Figure S3. Modeled Relationship Between Relative Risk of Cardiovascular Emergency Department Visits and Six Different Temperature Metrics. First Diagnosis Only

Figure S4. Modeled Relationship Between Relative Risk of Consequences of Heat and Dehydration Hospitalizations and Six Different Temperature Metrics

Figure S5. Modeled Relationship Between Relative Risk of Consequences of Heat and Dehydration Emergency Department Visits and Six Different Temperature Metrics.

Tables S4 and S5. The tables show the results of sensitivity analyses in which the Minimum, Increasing, and Excess Risk Temperatures (MRT, IRT, ERT, respectively) were calculated using different time periods for the health and meteorological data. The values in the table compare trigger points for the four health events emphasized in this manuscript and are based on daily maximum temperature. An asterisk (*) indicates the time period examined in the main text. All values shown are in degrees Celsius (°C).
